

Palm burning has no fatal effect on eggs and larvae. This palm before burning was previously sprayed twice with chlorpyrifos 48% EC (photos by V. Vassiliou and P. Kitsis).

Alive RPW larvae found two weeks after burning a date palm of the *Ph. dactylifera* palm species

Incorrect way of burning and keeping damaged palms. RPW is able to complete its development even after burning

Development and damage of palm is a continuous process even after burning a palm
